                                                                                                                                                                                                                                The present sequence represents the natural spider silk protein spidroine major 1. The protein improves the moisturizing/softening action of the compositions. The protein, and its fragments are used in cosmetic or dermatological compositions. These compositions are used as hair or skin care products; and make-up or sunscreens. As the protein is a good, persistent film-formers on the skin agents that are generally difficult to administer, e.g. vitamins, which and hair

                                                                                                                                                                       The spider silk protein contains a basic 34 amino acid repeat. The repeat itself contains 3 regions. The first comprises 0-9 amino acids with a sequence AGR(GGX)2. This region is not highly conserved. The second region has a sequence GAG(A)x which is highly and is 8-10-amino acids long. The third segment is (GGX)5 and is 15 amino acids long and is very highly conserved. In most in a silk having lower elasticity.

            Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DB DB

The method comprises administering an immunogenic amount of ospa in the form of a vaccine remed Ospa, or an immunogenic amount of particularly polkilothermic fish, against the bacterial pathogen partickettsial septicaemia (SRS) and other rickettsial diseases. The method is suffer the bacterial pathogen sequence represents DNA which has been optimised for expression in Escherichia coli to encode the P. salmonis Ospa protein. An Ospa protein anni-osna antibody resonnes

                                                    This invention relates to a method for the protection against infection of a poikilothermic fish by the bacterial pathogen, Piscirickettsia salmonis. The method comprises administering an immunogenic amount of oppa in the form of a vaccine. The method is used for protecting animals, rickettsial septicaemia (SRS) and other rickettsial gaginst salmonid expression in Escherichia coli fused to DNA encoding animals, rickettsial septicaemia (SRS) and other rickettsial diseases. The present P. salmonis OspA DNA termed (17E2 optimised for expression in Escherichia coli fused to DNA encoding an undefined is used in a vaccine to create an anti-OspA antibody response.
                                                                                                                                                                                                                         Method for protecting poikilothermic fish against salmonid rickettsial septicaemia and other rickettsial diseases comprises administering a vaccine containing the OspA protein of Piscirickettsia salmonis -

This invention relates to a method for the protection against infection of a polkilothermic fish by the bacterial pathogen, Piscirickettsia salmonis. The method comprises administering an immunogenic amount of a p. salmonis specific antigen termed OspA, or an immunogenic fragment of OspA in the form of a vaccine. The method is used for protecting animals, particularly polkilothermic fish, against the bacterial pathogen p. salmonis. The method is also useful for protecting against salmonid rickettsial septicaemia (SRS) and other rickettsial diseases. The present sequence represents DNA encoding the P. salmonis OspA protein. An OspA protein with an N-terminal fusion partner is used in a vaccine to create an anti-OspA antibody response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WPI; 200

                                                                                                                                                                                                                                                                                                                                                                                                                              This invention relates to a method for the protection against infection of a poikilothermic fish by the bacterial pathogen, Piscirickettsia salmonis. The method comprises administering an immunogenic amount of a OspA in the form of a vaccine. The method ospA, or an immunogenic fragment of particularly poikilothermic fish, against the bacterial pathogen salmonis. The method is also useful for protecting animals, rickettsial septicaemia (SRS) and other rickettsial diseases. The present sequence represents a PCR primer used in the cloning and optimisation of invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DЬ

The method comprises administering an immunogenic amount of a p. salmonis specific antigen termed OspA, or an immunogenic fragment of OspA in the form of a vaccine. The method is used for protecting animals, particularly poikilothermic fish, against the bacterial pathogen P. salmonis. The method is also useful for protecting against salmonid rickettsial septicaemia (SRS) and other rickettsial diseases. The present sequence represents a PCR primer used in the cloning and optimisation of the P. salmonis OspA gene. The OspA gene is used in the method of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention relates to a method for the protection against infection of a polikilothermic fish by the bacterial pathogen, Piscirickettsia salmonis. The method comprises administering an immunogenic amount of a R. salmonis specific antigen termed OspA, or an immunogenic fragment of OspA in the form of a vaccine. The method is used for protecting animals particularly polikilothermic fish against the bacterial pathogen P. salmonis. The method is also useful for protecting against salmonid rickettsial septicaemia (SRS) and other rickettsial diseases. The preser sequence represents a PCR primer used in the cloning and optimisation of the P. salmonis OspA gene. The OspA gene is used in the method of the

                                                                                                                                                                                                                                                                                                                                                                 11-JUL-2001 (first entry)
                                                                                                                                                                                                                                                                                                                                                                                                                          AAF86251 standard; DNA; 111 BP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention relates to a method for the protection against infection of a poikilothermic fish by the bacterial pathogen, Piscirickettsia salmonis. The method comprises administering an immunogenic amount of a OspA in the form of a vaccine. The method ospA, or an immunogenic fragment of particularly poikilothermic fish, against the bacterial pathogen particularly poikilothermic fish, against the bacterial pathogen rickettsial septicaemia (SRS) and other rickettsial diseases. The method is also useful for protecting against salmonid sequence represents a PCR primer used in the cloning and optimisation of invention. The salmonis OspA gene. The OspA gene is used in the method of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAF86256;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention relates to a method for the protection against infection of a poikilothermic fish by the bacterial pathogen, piscirickettsia salmonis. The method comprises administering an immunogenic amount of a particularly poikilothermic firmed OspA, or an immunogenic fragment of particularly poikilothermic fish, against the bacterial pathogen particularly poikilothermic fish, against the bacterial pathogen rickettsial septicaemia (SRS) and other rickettsial disasses. The present sequence represents a PCR primer used in the cloning and optimisation of sequence represents a PCR primer used in the cloning and optimisation of invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 111 BP; 16 A; 32 C;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Method for protecting poikilothermic fish against salmonid rickettsial septicaemia and other rickettsial diseases comprises administering a vaccine containing the OspA protein of Piscirickettsia salmonis .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention relates to a method for the protection against infection of a polkilothermic fish by the bacterial pathogen, Piscirickettsia salmonis. The method comprises administering an immunogenic amount of a P. salmonis specific antigen termed OspA, or an immunogenic fragment of OspA in the form of a vaccine. The method is used for protecting animals, particularly polkilothermic fish, against the bacterial pathogen P. salmonis. The method is also useful for protecting against salmonid rickettsial septicaemia (SRS) and other rickettsial diseases. The present sequence represents a PCR primer used in the cloning and optimisation of the P. salmonis OspA gene. The OspA gene is used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Hybridisation assay; genetic mapping; gene expression control; protein identification; signal transduction pathway; metabolic pathway; promoter; termination sequence; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                    06-SEP-2000

This sequence encodes a synthetic spider dragline variant monomer, DP-1B.9. The sequence of the DP-1B.9 polymer is given in AAR99055. The polypeptide monomer is a variant based on a consensus sequence derived from the fibre forming regions of spider dragline protein. The natural protein 1 (Spidroin 1) from Nephila clavipes. This sequence may be used in the recombinant production of the subtilis. Synthetic analogues of DP1 were designed to mimic the repeating consensus sequence of the natural protein and the pattern

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC of variation among individual repeats. DP-1B analogues were designed CC by reordering the four repeats within the monomer of DP1A. This CC monomer exhibits all of the regularities of (1)-(5) below. In addition, CC it exhibits a regularity of the natural sequence which is not shared by CC DP-1A, namely that a repeat in which both GYG and GRG are deleted is CC generally preceded by a repeat lacking the entire poly-alanine repeat, CC with one intervening repeat. The sequence of DP-1B matches the natural CC sequence more closely over a more extended segment than does DP-1A. The CC individual repeats differ from the consensus according to the pattern: CC (1) the poly-alanine sequence varies in length from 0-7 cC (2) when the entire poly-alanine sequence is deleted, CC (3) aside from the poly-alanine sequence and gARGGLGGQAGANGG; CC (3) aside from the poly-alanine sequence consecutive residues; (4) deletion of GYG is generally accompanied by deletion of GRG in the same asonuence. and

CC DP-1A.9. The sequence of the DP-1A.9 polymer is given in ARP9053.

CC The polypeptide monomer is a variant based on a consensus sequence CC derived from the fibre forming regions of spider dragline protein, CC esp. the natural protein 1 (Spidroin 1) from Nephila clavipes. This CC DNA sequence may be used in the recombinant production of the CC variant protein in a recombinant host, e.g. E. coli or Bacillus CC subtilis. Synthetic analogues of DP1 were designed to minic the CC repeating consensus sequence of the natural protein and the pattern CC of variation among individual repeats. DP-1A analogues are composed CC of atandemly repeated 101 amino acid monomer which comprises four crepeats which differ from the consensus sequence given in AAW06201, CC according to the pattern (1)-(5) given below. This 101 amino acid CC monomer is repeated 1-16 times in a series of analogue proteins. The CC individual repeats differ from the consensus according to the pattern. CC (1) the poly-alanine sequence varies in length from 0-7 creating is the surrounding sequence according to the pattern.
                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This is the nucleotide sequence encoding the lycopene cyclase enzyme from Erythrobacter longus ATCC 14126. The gene was isolated from an E.longus genomic DNA library using a 1 kb fragment of the phytoene dehydrogenase gene from Erwinia hebicola as a probe. The probe isolated once 1578 bp) encodes the phytoene dehydrogenase (AAT31798) whereas ORF1 (1302 bp) encodes the phytoene dehydrogenase (AAT31798) whereas ORF1 plasmid probes lycopene cyclase. The two ORFs were inserted into the Rhodobacter sphaeroides for prodn. of the proteins. The phytoene dehydrogenase and lycopene cyclase can be used to produce beta-carotine effects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          900

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
